15 reduce an entire plant to a heap of collapsed tissue in mere days. In one recent study, Nina Theis and Lynn Adler took on the specific problem of the Texas gourd—how to attract enough pollinators but not

20 too many beetles. The Texas gourd vine's main pollinators are honey bees and specialized squash bees, which respond to its floral scent. The aroma includes 10 compounds, but the most abundant—and the only one that lures squash bees

25 into traps—is 1,4-dimethoxybenzene. Intuition suggests that more of that aroma should be even more appealing to bees. "We have this assumption that a really fragrant flower is going to attract a lot of pollinators," says Theis, a chemical

30 ecologist at Elms College in Chicopee, Massachusetts. But, she adds, that idea hasn't really been tested—and extra scent could well call in more beetles, too. To find out, she and Adler planted 168 Texas gourd vines in an Iowa field and,

35 throughout the August flowering season, made half the plants more fragrant by tucking dimethoxybenzene-treated swabs deep inside their flowers. Each treated flower emitted about 45 times more fragrance than a normal one; the other half of

40 the plants got swabs without fragrance. The researchers also wanted to know whether extra beetles would impose a double cost by both damaging flowers and deterring bees, which might not bother to visit (and pollinate) a flower-laden with

45 other insects and their feces. So every half hour throughout the experiments, the team plucked all the beetles off of half the fragrance-enhanced flowers and half the control flowers, allowing bees to respond to the blossoms with and without interference by

50 beetles. Finally, they pollinated by hand half of the female flowers in each of the four combinations of fragrance and beetles. Hand-pollinated flowers should develop into fruits with the maximum number of seeds,

55 providing a benchmark to see whether the fragrance-related activities of bees and beetles resulted in reduced pollination. “It was very labor-intensive,” says Theis. “We would be out there at four in the morning, three

60 in the morning, to try and set up before these flowers open.” As soon as they did, the team spent the next several hours walking from flower to flower, observing each for two-minute intervals “and writing down everything we saw.”

65 What they saw was double the normal number of beetles on fragrance-enhanced blossoms. Pollinators, to their surprise, did not prefer the highly scented flowers. Squash bees were indifferent, and honey bees visited enhanced flowers less often

70 than normal ones. This thinks the bees were repelled not by the fragrance itself, but by the abundance of beetles: The data showed that the more beetles on a flower, the less likely a honey bee was to visit it.

75 That added up to less reproduction for fragrance-enhanced flowers. Gourds that developed from those blossoms weighed 9 percent less and had, on average, 20 fewer seeds than those from normal flowers. Hand pollination didn’t rescue the seed set,

80 indicating that beetles damaged flowers directly —regardless of whether they also repelled pollinators. (Hand pollination did rescue fruit weight, a hard-to-interpret result that suggests that lost bee visits did somehow harm fruit development.)

85 The new results provide a reason that Texas gourd plants never evolved to produce a stronger scent: “If you really ramp up the odor, you don’t get more pollinators, but you can really get ripped apart by your enemies,” says Rob Raguso, a chemical ecologist

90 at Cornell University who was not involved in the Texas gourd study.

The primary purpose of the passage is to:

- (a) discuss the assumptions and reasoning behind a theory.

- (b) describe the aim, method, and results of an experiment.
- (c) present and analyze conflicting data about a phenomenon.
- (d) show the innovative nature of a procedure used in a study.

Solution

Q. Direction: After reading the passage choose the best answer to the given question based on what is stated or implied in the passage and in any accompanying graphics (such as a table or graph). Questions are based on the following passage.

Texas gourd vines unfurl their large, flared blossoms in the dim hours before sunrise. Until they close at noon, their yellow petals and mild, squashy aroma attract bees that gather nectar and shuttle

5 pollen from flower to flower. But “when you advertise [to pollinators], you advertise in an open communication network,” says chemical ecologist Ian Baldwin of the Max Planck Institute for Chemical Ecology in Germany. “You attract not just

Q. Direction: Study the following information and answer the given question. Ryan was looking forward to sleeping over at his friend Robert's house. Though they had been classmates for a while, the two had only recently become good friends. Ryan packed up his sleeping bag, a pillow, and a few of his favorite toys and games, and then his mom dropped him off at Robert's. Robert met Ryan on the porch and the two did their secret handshake and started playing right away. First they played pirates in Robert's tree fort. Next they played ninjas in the driveway. Then it started getting dark and they went inside of Robert's house. As soon as they walked in the house, Ryan's eyes starting getting red and itchy. He saw a big orange cat sitting on the couch. Then he started sneezing uncontrollably. "I'm sorry, Robert. It's been a lot of fun, but I have to call my mom." Why do Ryan's eyes get red and itchy when he walks into Robert's house?
